

conducting a search relative to a plurality of sentence element categories associated with a plurality of object data items, based on a single search word or a plurality of search words;

retrieving the object data associated with the attribute word that matches a single search word or a plurality of search words and outputting the object data thus retrieved; and

using at least a search word having an agent of action category, a search word having an action category and a search word having an object of action category.

SUB C27

5. (Amended) A computer-readable recording medium stores data according to a relational database structure, wherein tuples each comprising an object data item and a plurality of attribute words categorized according to sentence elements of a natural language are stored and tuples are filtered for attribute relations based on the grammatical structure of the natural language.

Please add the following new claims:

6. The relational database structure according to claim 1, wherein a plurality of tuples retrieved in a search are filtered so that overlapping tuples are filtered off and filtering for attribute relations based on the grammatical structure of the natural language is performed

7. The relational database structure according to claim 3, wherein a plurality of tuples retrieved in a search are filtered so that overlapping tuples are filtered off and

b3 filtering for attribute relations based on the grammatical structure of the natural language is performed. --
